Introduction

This report contains the results for performance trials from commercial corn hybrids produced for silage at four locations in Virginia in 2023, as well as two-year average performance when available. In order to avoid problems with comparisons over sites and years, multi-year yields are presented as a percentage of the total, called relative yield, at that particular site-year combination. All locations were planted with a SRES Step 4 Plot planter and harvested with commercial silage equipment. Yields are presented on a dry matter and 35% dry matter basis for comparison. Quality analysis was performed using a Foss NIR XDS Rapid Content Analyzer. All hybrids entered in the Virginia trials were submitted for testing by commercial companies. The locations at which particular hybrids were entered were specified by the company. Companies entering hybrids were charged a fee for each hybrid per location to support the Virginia Corn Silage Performance Trials.

Yield Differences

Experimental plots vary in yield and other measurements due to location in the field and other factors which cannot be controlled. Statistics given in the tables are intended to help the reader make valid comparisons between hybrids. The magnitude of difference due to uncontrollable variation has been computed for the data and is listed at the bottom of columns as the LSD (.10) (least significant difference with 90% confidence). Differences less than the LSD are assumed not to be real differences with 90% confidence.

Hybrid Selection

Multi-year results are more reliable than single-year results.

When making hybrid selections it is important to realize that hybrids differ in their performance under differing environments. Some hybrids are more adapted to a wide range of environments. Hybrid performance may differ with year and location variations of rainfall, temperature, pests and other environmental variables. In these experiments, many hybrids have essentially the same yield, and great care should be taken in interpreting the results of a single year's tests, especially at only one location.

For these reasons it is important, whenever possible, to also look at a hybrid's average yield across locations when making selections. Multi-year averages give greater confidence to hybrid performance decisions. Relative yield tables compare the yield of a hybrid to the average yield of all hybrids in the test. These tables are an excellent summary of yield potential compared to other hybrids.

Understanding Relative Yield

Companies entering silage hybrids decide which hybrids are planted at which locations. In 2023, some hybrids were planted at all four locations and others at only one or two sites.

Combining and comparing absolute yield and other results from multiple sites is inappropriate when not all hybrids are planted at all locations. For example, one hybrid might have an unfair advantage in such a comparison because it was tested only at sites with ideal growing conditions. Another hybrid tested at sites with less-than-ideal growing conditions would have yields that tended to be lower. In this example, it would be difficult to determine whether yield differences were because of differences in genetic yield

potential or simply because of differences in the environmental conditions under which they were tested. The solution is to compare hybrids based on relative yields rather than absolute yields.

To calculate relative yield, the yield for each hybrid at each site is divided by the average yield for all hybrids tested at that same site and multiplied by 100. Once each hybrid at each site has been assigned a relative yield, comparisons can be made between hybrids tested at the same site or different sites. For hybrids tested at multiple sites, we can also calculate a multi-site relative yield average.

Relative yields of 100 indicate hybrids that were average performers. Relative yields greater than 100 indicate yields above-average. Relative yields less than 100 indicate yields below-average. The magnitude of the relative yield numbers indicates how far above or below average a hybrid performed. For example, a hybrid with a relative yield of 110 yielded 10% above the average yield for all hybrids at that site.

Selecting hybrids for both yield and quality

Milk2006 is used to condense multiple corn silage quality and digestibility factors into one easy-to-compare “milk-per-ton” number. This system also generates a “milk-per-acre” rating for each hybrid, calculated by multiplying yield (tons-per-acre) by quality (pounds of milk per ton). The same problem described above for multi-site yield comparisons exists for yield by quality comparisons: not all hybrids were tested at all sites. Therefore, relative quality and relative yield x quality ratings were calculated.

Milk2006 is a system developed by University of Wisconsin researchers to simplify quality comparisons between corn silage samples. Included in the analysis are variety identification, kernel processing, dry matter, crude protein, NDF, in-vitro NDF digestibility, starch percent and yield per acre. Compared to Milk2000, Milk2006 values more accurately address the effects of fiber digestibility on silage quality. Milk2006 has proven to more accurately reflect actual milk production than earlier versions of the program.

Milk2006 was designed solely as an index to be used when making quality comparisons between silage samples or hybrids. Milk-per-ton or milk-per-acre numbers should not be used to predict actual milk production on your farm. Milk-per-ton is more accurate at predicting cow performance since it includes quality factors that affect milk production. Milk-per-acre allows consideration of yield as well as quality factors.

Use other information

Consider as much other information as possible from other independent sources before selecting hybrids. Look for agronomic, as well as silage quality data.

2023 Virginia Tech Corn Silage Hybrid Trials Plot Information

(Rates are on a per acre basis.)

Blackstone (Southern Piedmont Agricultural Research & Extension Center)

Planted: April 2023, conventional tillage
Harvested: August 2023
Population: 27,878 plants/acre
Pesticide: 2.5qt Bicep, April 2023
Fertilizer: 1000 lbs 10-10-10, April 2023; 60 lbs UAN top-dressed, May 2022.
Plot Size: 2 rows 27.5' x 30" 4 replications
Soil Type: Appling sandy loam
Cooperator: Ned Jones

Orange (Northern Piedmont Center)

Planted: April 2023, no-till into soybean stubble
Harvested: August 2023
Population: 24,111 plants/acre
Pesticide: 1.5 qt Lumax® + 2 qt glyphosate + 1 pt atrazine, April 2023; .67 oz Accent, April 2023
Fertilizer: 183 lbs 30-60-20, April 2023; 100 lb N, June 2023
Plot Size: 2 rows 25' x 30" 4 replications
Soil Type: Davidson clay
Previous crop: Soybeans
Cooperators: Greg Lillard

Shenandoah Valley (Thanks to David Yutzy, Windcrest Holsteins.)

Planted: May 2023, no-till

Harvested: September 2023

Population: 20,482 plants/acre

Pesticide: 1 qt glyphosate + 1 pt atrazine preplant, 3.6 pt Halex at V5.

Fertilizer: 50 lb potash and 40 lb sulfur in January; 5,000 gallons dairy manure injected preplant; 17 gal 15- 15-0-2S-.13B-.25Zn at planting; 75 lb N from urea side-dressed

Plot Size: 2 rows 37.5' x 30" 4 replications

Cooperators: Doug Horn and David Yutzy

Washington County (Southwest Virginia Agricultural Research & Extension Center)

Planted: May 2023, no-till

Harvested: September 2023

Pesticide: 2 quarts Trizmet, 1 quart glyphosate

Fertilizer: 155-53 -141- 26S - 6 Zn preplant; Side dressed with 78 pounds N at V8

Plot Size: 2 rows 35' x 30" 4 replications

Soil Type: Wyrick-Marbie silt loam

Cooperator: Phil Blevins

1 Days to maturity provided by company; differences in maturity rating methods may exist between companies.

2 Hybrids tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

3 Relative Ton per Acre (yield) calculated by dividing Ton per Acre for each hybrid at each site/year by the average Ton per Acre for that site/year.

Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

Green shading indicates higher average; Red shading indicates lower average.

-- Indicates data loss

* Indicates numbers not significantly different from the highest (or lowest for ADF and NDF) value in that column, i.e. within one LSD of the top performer.

Table 4. Multi-year, Multi-site relative milk per ton (quality).

1 Days to maturity provided by company; differences in maturity rating methods may exist between companies.

2 Hybrids tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

Relative Milk per Ton (quality) calculated by dividing Milk per Ton for each hybrid at each site/year by the average Milk per Ton for that site/year.

Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

Green shading indicates higher average; Red shading indicates lower average.

*-- Indicates data loss

* Indicates numbers not significantly different from the highest (or lowest for ADF and NDF) value in that column, i.e. within one LSD of the top performer.

Table 5. Multi-year, Multi-site relative milk per acre (yield x quality)
